

Rocket Folio/NXT Folio Builder

Flexibility and automation in building and maintaining infobases

Internet tools

Security and commerce-enabling features

Easy distribution of content

convert, compile and secure professional information.

Rocket Folio infobases serve as secure containers that make information more valuable to end users and more manageable for publishers and corporate information managers. Rocket Folio Builder makes it easy to collect information from diverse sources and file formats, combine their contents into a Folio infobase and manage user access rights. Folio Builder was created for information specialists who organize, update, and maintain collections of information, and it also serves commercial publishers of electronic information titles.

benefits of the folio builder product suite

The Folio Builder product suite, which has now been fully tested and is fully supported on both Windows Vista and Windows 7-, 32- and 64-bit platforms, has long been recognized as the premier rich-client application suite for assembling, enhancing, securing and publishing high-value reference information. The Folio Views client includes an extremely fast search engine, intuitive navigation and many research features that can be personalized to help users pinpoint the information they need.

The Rocket Folio product suite helps publishers, corporations and developers leverage the value of knowledge exchange. Rich search features and robust technology explain why the world's top 10 publishers of professional information, and the majority of Fortune 500 companies, depend on Rocket Folio Views software to access, adapt and publish professional information on CD/DVD-ROM, corporate intranets and the Internet.

flexibility and automation in building and maintaining infobases

Folio Builder manages the conversion of gigabytes of source files into Folio infobases, providing complete control over the build process from the first steps of data conversion through the final steps of indexing and compressing. Because the process of building indexed content varies from firm to firm, Folio Builder provides tools with both flexibility and automated control in mind. Once configured, the steps required to create a final product involving conversion, markup, compression, validation and indexing of your content can be saved and repeatedly executed with a single command.

versatile filters

Robust filters convert popular file formats directly to Folio infobase format. Each filter preserves text markup, including tables, from the original files.

quality assurance

To provide confidence in your finished product, Folio Builder includes Validator, a utility that checks infobase syntax, verifies links, and generates a report about the contents of an infobase detailing how styles are used.

internet tools

Folio Builder provides both URL and HTML file importers to convert documents, websites or collections of sites. It then automatically imports converted files into Folio infobase format while preserving all relative links within the site. This import can be combined with other file types to create a portable, single-source information collection. Users can also create links to live websites directly within their infobase.

security and commerce-enabling features

rights management

Folio Builder lets information owners control who can access information, what they can do with it, how long they can use it and how many concurrent users are allowed. Folio Builder can generate passwords that unlock secure or expired data.

usage metering

When tracking usage is important, meters allow information publishers to gauge the relative popularity of document subsections, to bill users for information access, or to unlock secure or expired data.

easy distribution of content

single file for easy distribution

Rich text complete with hypertext markup, graphics, tables and other object types are all stored in a single, fully indexed file.

data compression

To maximize storage capacity, Folio Builder compresses information, helping maximize storage resources whether infobases reside on a server, notebook computer or CD-ROM.

make information your advantage

With the wrong tools, managing today's flood of information—and providing usable access to it for employees and customers—can be overwhelming. Folio Builder makes the job easy with a wide variety of import filters, flexible automation, Internet capability, and advanced security and rights-management functions.

record-level security

Information can be secured to any level of granularity within an infobase. Data can be distributed to multiple users while preserving control over who can access, edit, annotate, export, search, and print various document subsections. Encryption technology from RSA Security protects secured information from unauthorized use.

custom search forms

To accommodate the specialized needs associated with professional information, and to help publishers distinguish their functionality from those of their competition, Folio Builder lets users create custom query dialogs for end users. Custom search dialogs can be based on either the Boolean or Relevance Ranked query syntax.
